Peptides Na1758-80 are specific examples of a novel generic proteinsse A peptide substrate (RRITS) and are modified with substrate to develop a detectable colour or fluorescence after cleavage of the Phe-he to proteinsse A. The peptides are used to determine proteinsse A activity in a sample e.g. bear froot.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a synthetic peptide which has a high affility for glycomanoglycans and proteoglycans. The peptide is useful in methods for modulating heparin or other glycomanoglycans with anticogulant activity, promoting call attechment or adhesion to natural or synthetic surfaces (especially went grafts), modulating tumour cell metastasis, modulating cartilage differentiation, targeting drugs to epithelial call surfaces (or to other cells expressing proteoglycans), modulating enzymes that act on glycomaninoglycan substrates, affinity purification of bloative sequences of a glycomaninoglycan, modifying endothelial cell pro-cosquiant or guitchoosquiant functions mediated through glycomaninoglycans, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mowel synthetic peptides with high affinity for glycoaniooglycans and proteoglycans, useful for modulating heparin, promoting cell attachment, modulating tumour metastasis and modulating wound healing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Glycoaminoglycan; proteoglycan; heparin modulation; anticoagulant; cell attachment; cell adiseion; verin graft; tumour cell metastasis; cartilage differentiation; wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide modulating activity of heparin, and other glycans.

```
The present sequence represents a synthetic peptide which has a high caffinity of glycoalinocytoans and protecty-quans. The peptide is useful in methods for incolutating leparin or other glycoaninoglycans with controsquant activity, promoting cell attachment or adhesion to natural or synthetic surfaces (especially vein grafts), modulating or natural or synthetic surfaces (especially vein grafts), modulating orthing catilised differentiation, targeting of drugs to epithelial cell surfaces (or to other cells expressing care opithelial cell surfaces (or to other cells expressing substrates, affinity purification of bicactive sequences of a caubitrotes, affinity purification of bicactive sequences of a canti-coaquiant functions meditated through glycoaninoglycans, and modulating venue heaptin sediated through glycoaninoglycans, and tissue uptake of heaptin or other glycoaninoglycans in a nammal to increase heparin half-life in circulation.
                                                                                                                                                             ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Movel synthetic peptides with high affinity for glycomninoglycans and proteglycans, useful for modulating heparin, promoting cell pattechence, modulating tumour metastasis and modulating wound healing
                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Glycoaminoglycan; proteoglycan; heparin modulation; anticoagulant; cell adhesion; vein graft; tumour cell metastasis; cartilage differentiation; vound healing.
modulating wound healing. The peptide may also be used for blocking tissue uptake of heparin or other glycomainoglycans in a mammal to increase heparin half-life in circulation.
                                                                                                                                                             0;

Sequence

```
The present sequence represents a synthetic peptide which has a high of affinity for glycoaminoglycans and proteoglycans. The peptide is useful to methods for modulating hearin or other glycoaminoglycans with cantiloring anticopy prometry, prometry, prometry, prometry, prometry, prometry, prometry, prometry cell actediment or adhesion or antural or synthetic surfaces (especially with grafts), modulating or thing cafficient, progeting or proteoglycans, modulating cartilated enfirsteristic, trageting or proteoglycans, modulating oratilates that professing the substrates affinity purification of bloactive sequences of a glycoaminoglycan, modilating the proteograph processing or anti-cogniant functions mediated through glycoaminoglycans, and codulated through glycoaminoglycans, and codulated through glycoaminoglycans, and clistes expressing the peptide may also be used for bloaking through expense hearting in a precision or chief glycoaminoglycans, and increase hearting in a pricellation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel synthetic peptides with high affinity for glycoaminoglycans and protegyycans, useful for modilating hepatin, promoting cell attachment, modulating tumour metastesis and modulating vound healing

An oriented degenerate peptide library of the amino acid formula CR 79761 was constructed to isolate the amino acid sequences at the phosphorylation sites of a protein kinase a. Peptides which are protein kinase b., co cyclin kyjsidce2), are family kinases, etc. Peptides which are phosphorylated are isolated and their amino acid sequences are compared to known substrate/inhibitor peptide sequences for that protein kinase. The peptides Ry9674-88 represent phosphorylation sites for the cell cycle control kinases cyclin B/532(acd2) or cyclin B/9310073. This septide assequence is the second phosphorylation site in the Kanopus histone HI. The isolated peptides can be used to screen ords for effects on the protein kinase activity generate artibodies to identify native kinase construction are in the control in an activation and activation or call development.

The present invention describes a substrate for lck comprising a 9 amino acid peptide (1). Also described is a method of inhibiting kinase activity of 1cb by contacting it with (1) in vitro. The peptide is useful for determining substrate specificity of a protein kinases information on the substrate specificity of protein kinases in signal transduction onthe substrate specificity of protein kinases in signal mechanisms and could allow for the design of therapeutic agents. The present sequence represents a peptide used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Manumalian Ii key peptide; mammalian invariant chain protein; allergy; immune response; MHC class II; antigenic; autoimmune disease.
                                                                                                                                                                                                                                                                                                                             Peptide substrate for a kinase, useful for determining substrate specificity -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AE101 alanine scanning analogue effector compound SEQ ID NO:114

The present sequence represents an AEIOI analogue effector compound (C. Osed, in the present invention. The present invention in the present invention in the present invention. The present invention in describes control and an anamalian invention the profess of the profess and method can be used for the modulation of an immune response for the represent of an analogue of an immune response for the represent of an annual response for the represent of an analogue of an immune present of the profess of the present of an immune of the present of the present of the present of an immune of the instance of the profess of the present of an immune disease. The immunosuppression can be used in the present of an immune disease, the immunosuppression can be used on the present of an immune disease, the immunestyperses of the present of an immune disease, or the themstood arthitis, or prories or allograft rejection:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                           New mammalian invariant chain protein (11) key peptide(s) - used for moditation of fammen response, e.g. for treating malignant, allergic or autolimune disease or allograft rejection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Monomer of repetative primary structure of a synthetic fibrous protein.

The present sequence represents a peptide which is recognised by rabbit to gig antibodies. The antibody that recognises the present peptide may be used in the method of the invention. The specification describes a method of sorting a mixture of nucleic acids derived from GNBs.

The think of or sorting a mixture of nucleic acids derived from GNBs.

The properties of the reaction (FNB, using distinguishably labellar is a properties to the interest of the libraries of the interest of the inte
labels may be peptides or antibodies. The present esquence is an example of this peptide without may be used as a label. The method is useful in detecting SNRs which may be related to numerous inherited human diseases, including cancers, inercloding cancers, including cancers, and addition diseases, and addition diseases, and addition to the cancer and diseases and autoimnument diseases. In addition, it can be used to detect and daysows lyme diseases, tuberculosis and sexually transmitted diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptide-Labeled Oligonucleotide methods for manipulating, e.g. labeling, isolating or screening, populations of nucleic acids involve the use of distinguishable and identifiable peptide tags linked to oligonucleotide primers
                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    IgG antibody; cDNA library; nucleic acid sorting; gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to methods for detecting single aucleotide polymorphisms (SNPs) using peptide labelled oligonucleotides and antibody arrays. Oligonucleotide probes with identifiable labels are used in the NELIGENESM MURETION Screening Peptide-Linked (YGMS-PL) method. These
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           High-throughput nucleotide polymorphism analysis using peptide-labeled obliganuleotide probes, useful for analysis of gene expression and defecting atternatively spliced RRA transcripts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                  The polymer of the peptide may act as an analogue to peptides conty, a repetetive or quasi-repetetive structure ag. collagen, elastin, keratin, troponin C, dopa proteins, silk proteins, bloadhesive proteins and insect cuticie proteins. These prodeins may be useful in the manufacture of fibrous products, synthetic skin and oosmetic additives.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Single nucleotide polymorphism: SNP; antibody; label; rabbit; car

Lys/Ala diastereomer peptide [D]-A3,4,8,10-K4A8.

```
R88700-01 are T-cell epitopes derived from the Alt a 12 allergen protein (R88672) stolated from Alternaria alternate. Peptide epitopes from Alternation of allergy caused by Alt. 4 & 5 and 12 (by reaction with 15 % in serum). They can also detect collular reaction to the specified altergenes (from their stimulatory or inhibitory effect on this reaction). The peptides can also be used therapeutically to induce immunotolerance or anergy of T lymphocytes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0; Gaps

```
This sequence represents a Lys/Ala diastereomer paptide of the invention. The peptides of the invention have; (a) cyclytic activity on pathogenic cells (pathogens and malignant cells not naturally present in pathogenic cells (pathogens and malignant cells not naturally present in the body), but (b) no hamonjvie cartivity. So with activity only at a concentration significantly higher than that at which they lyse to concentration significantly higher than that at which they lyse is the peptides. The peptides, their complexes and markures are used to treat infections (caused by bacteria, fundi, protozoa, mycoplasma or viruses) or cancer, in human and veterinary medicine Also, they can be used as a gricultural periodic. The absence of hamonjvito activity (associated with disturbance of alpha-helical structures) means that the peptides had sixulpance of alpha-helical structures) means that the peptides continues it may take it any toxic effects, and those that include bea will have contracted a sixtence to protocolytic degradation. Non-hemolytic, cyctoxic random copolymers of pardaxin, each has a specific spectrum of creasistance to them is unlikely to develop.
Lys/Ala diastereomer peptide; infection; therapy; excitatory neurotoxin; none be venon; pardaxin, cytolytic activity; cancer; non-haemolytic; preservative; agricultural produce; bacterial cell lysis; agricultural pesticide, cell wall lysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide(s) having selective cytolytic activity - against pathogens and malignate Cells, but no haemolytic activity, used for treating lifections and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note= "C-terminal amide"
                                                                                                                                                                                                                                                                                                                                                  /note= "D-form residue"

The present peptide is used to produce the agents of the invention. The present peptide is used to produce the agents of the invention. The complex conscribes a non-laemolytic, originate and the is a complex of bundled peptides, a marture of peptides or a random comperide, a complex. The agent has a selective expolytic activity or a random comparison or a random comparison or a replication of the agent is selected from a cyclothic activity of a peptide which has a net positive charge greater than 1, comprises in alpha-helix between molecy or a peptide (or cyclot derivative of this) which comprises in alpha-helix between molecy or a peptide (or cyclot derivative of this) which comprises in alpha-helix between molecy or a peptide (or cyclot derivative of this) which comprises in allowable than 1 and has an amino acid residues and the positive charge greater than 1 and has an amino acid sequence such that cost sequence comprising only Lambo acid residues in a corresponding amino acid sequence comprising only Lambo acid residues in the corresponding amino acid sequence comprising only Lambo acid residues of some or for business of several diseases acused by pathogens.

Comprises to used in both human and veterinary medicine in They may be used as distinfectants for destruction of microorganisms, 1.e. in the comparison of middles (e.g. fungicides or comparison or for preservation of agricultural products.
                                                                                                                                                                   Non-haemolytic; cytolytic; salective cytolytic activity; pathogen; cancer; infection; disinfectent; contact lens wetting solution; preservative, pesticide; fingloide; backericide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New non-haemolytic cytalytic agent useful in treating cancer or
infections - is a peptide compitsing a molety which disrupts the
continuity of an alpha-helical structure

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A novel synthetic virus like particle (SVLP), comprises a recombinant included acid molecule and a non-rovalantly associated set of nonlesic acid condensing peptides (NACP), e.g. a peptide comprising the present consensus sequence, where each NACP is a heteropeptide, and the NACP set has low polydispersion. The SVLP, which is for transfecting a nucleic evid molecule into a marmalian ocell, can be used for gene therapy. It is self assembling and can be designed to target a particular cell or tissue type and deliver the nucleic acid molecule into its chromosomal or extrachromosomal
                                                                                                                                   Synthetic virus 11ke particle; nuclaic acid; condensing peptide; heteropequide, polydispersion; transfection; mammalian cell; gene therpy; self assembly; consensus:

Transfection of cells with nucleic acid(s) - comprises use of peptide(s) screened for interaction with nucleic acids on sensor chip by surface plasmon resonance Disclosure, Page 23; 75pp; English.

This sequence represents a nucleic acid condensing peptide that was challed indentified using the method of the invention. The method is for screening teat peptides for the ability to optimally transfect cells with a nucleic condition of a caid molecule (NRM), and comprises; (a) directing a change in the surface of plasmon resonance (SPR) of a nucleic acid immobilised on a sensor chip and exposed to a solution of a test peptide, where the change in SPR co-cours upon binding of the peptide and a solution of the peptide city of a nucleic acid, to permit calculation of the applied city that is mobilised uncles acid, to permit calculation of the applied city with a value of Ix10-12 to Ix10-6 (b) selecting the specified having K(d), with a value of Ix10-12 to Ix10-6 (c) selecting the specified having K(d), with a value of Ix10-12 to Ix10-6 (c) and with a value of Ix10-6 to Ix10-11. The methods can be used for conditionally appending appecting the specified naving binding capacity for nucleic acid to complex that is stable in the bloodstream, that the cytoplasm and to the nucleus, and capable of efficient transport contractions.

TYPE: PRF ORGANISM: Artificial Sequence PEAUTR: CTATE INVORMATION: Description of Artificial Sequence: Xenopus histone OS-08-369-643-89.
RESGILT 4

US-08-359-643-28

Sequence 20, Application US/08359643A

Pettert No. 6004757

GENERAL INFORMATION: Levis C.

APPLICANT: Songlang, Albou

TITLE OF INFORMATION: Substrate Specificity of Protein Kinases

FILE REPERMORE: CNS-001CP

CURRENT FILMS DATE: 1995-01-06

EARLIER FILMS DATE: 1995-01-06

NUMBER OF SEQ ID NOS: 92

SOFTWARE: Patentin Ver 2.0

LENGTH: 92

Ped. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention relates to a method of producing and purifying a hybrid of projectice (I) by affinity chromotography on a support carrying sulphated polysacotarides (Sp). (I) consists of a protein (II), at least one motif (II) of formula XYZYYZYYZY and 0-5 motifs (Sz) of formula XXZYYZZYZYZY, A consists of a protein (II), at least to XXZYYZZYZXX, where XI-X4 = K or R; and YI-Y3 = any amino acid, but correctly the consists of RI and RZ is chosen and according to the affinity required between (I) and SP, provided that if one of the consists of the mixt be at least two RI. Optionally purified (I) is treated with a serine protease to remove RI and RZ, leaving (II). This copyreptide, The method comprises inserting the coding sequence for (I) optionally with a of IM said (YI) and vector able to express (I). The vector is introduced into solitable on the construction of the motification of the construction of the motified (I) is contacted with ismobilized SP and bound where (II) includes a vaccinating antigen (A) optionally with vector of RZ and Claim 4; Page 44; 61pp; French

Disclosure; ; Ipp; English.

The polymer of the peptide may act as an analogue to peptides coolig, a repetetive or quasi-repetetive structure eg. collagen, elastin, keratin, troponin c, dopa proteins, silk proteins. bloadhesive proteins and insect cuticle proteins. These products may be useful in the manufacture of fibrous products, synthetic skin and obsmetle additives.

```
The invention relates to a new method of identifying an inhibitory peptide. The method comprises contacting a selected peptide able to bind a Group A mucopeptide (MPI) and a lipopolysaccharide (LPS) molecule with: (a) MPI, and (b) a mucopeptide antibody (ABI) and selecting a peptide which inhibits binding of MPI with ABI. The inhibitory peptide obtained which method is used to treat septic shock in mammals. ABI is used to prevent or treat arthritis in animals. The selected peptide is

```
used in a method for identifying antigenic peptides that are used to prevent or ameliorate experimental arthritis induced in an aimal. In its broadest application the antibodies raised against group, A mucopeptide can be used for the treatment of inflammentory diseases such as septic shock, and ribemulating arthritis, crohn's disease, psoriasis, and for the identification of specific peptides that can be used in such treatment. The present sequence represents the structure of a peptidoglycan mucopeptide)

Warren GJ, Mueller GM, Mckown RL, Dunsmuir P; (DNAP-) DNA PLANT TECHN COR

WPI; 1990-361428/48.

New anti-freeze polypeptides - used for cryo-protection of e.g. foods, medically used biologics, plant prods. or plants during growth.

Disclosure: Fig 4; 111pp; English.

Synthetic anti-freeze polypeptides (saf) comprise a specifically cleavable site and a region cortaining at least two "core" sequence such as the liner given here. The saf's suppress ice crystal growth by binding to the growing crystal face and blocking sites for further crystal growth. They can be used to maximise recention of important properties of organic materials through freezing and thawing processes. The basic design of the polypeptides is based on known antifreeze polypeptides from insects and fish, e.g. the wither flounder. RESULT 6

This sequence regresents a Lys/Ala disstereomer peptide of the function. The peptides of the invention have (a) cyclytic activity on pathogenic cells (gathogens and malignant cells not naturally present in the peptides to the invention have (a) cyclytic activity on a pathogenic cells (gathogens and malignant cells not naturally present in the body;) but (b) no haemolytic activity, or such activity only at a concentration significantly higher than that at which they lyse to concentration significantly higher than that at which they lyse in the peptides. Their complexes and mixtures are used to treat infections (caused by bacteria, fund; protozoa, mycoplasme or viruses) concancer, in human and veterinary medicine, Also, they can be used as preservatives for food, cosmetics and agricultural produce, or as preservatives for food, cosmetics and agricultural produce, or as a controlled and the peptides of the period of the peptides of the and the feet is and those that include be a will have increased resistance to protectly the derivation with a sepecific spectrum of activity, allowing selection or agents for particular applications. Since these random copolimes induce total lysis of bacterial cell walls, Peptido(s) having selective cytolytic activity - against pathogens and malignant cells, but no heemolytic activity, used for treating infections and cancer Example 4; Page 45; 80pp; English.

The present peptide is used to produce the agents of the invention. The present peptide as non-haemotytic, ortolytic agent, which is a peptide, a complex of bundled peptides, a mixture of peptides or a random peptide opeptide operations and an experience of peptides or a random peptide operation of the peptides or a mixture of peptide operations. The agent is selected from a cyclotic derivative of pathogenic cells. The agent is selected from a cyclotic derivative of a pathogenic cells. The agent is selected from a cyclotic derivative of a comprise. The agent is selected from a cyclotic derivative of this) which because modety, or a peptide (or cyclot cervative of this) which comprise and order pestides and comprises an alpha-helix comprise. The agent than 1 and has an amino acid sequence such that postive charge greater than 1 and has an amino acid sequence such that conversing amino acid sequence comprising only transhorted residues and conservative. The cyclotic agents hay be used for treatment of several diseases caused by pathogens, conservative the sed in both human and veterinary medicine. They may also be used a disinfectant for destruction of microorganisms, i.e. in the conservation of microorganisms, i.e. in the conservation of microorganisms, i.e. in the conservation of preservation of agentidices or the preservation of agentidices or bactericides or the preservation of agentidices or the preservation of agentidicates or the preservation of the preserv

The invention provides a method for disquosing ulcerative colitis in a subject suspected of having inflammatory bowed disease. The method comprises reacting a patient sample with a porth actigen that is interpreted that it is manusologically reactive with pANGA (Perinoclear activisation) of cytopiasatic antibodies; and detecting formation of a Sg-paNGA complex all cartice of ulcerative colitis or memory of the sequences 157362-367 represent pANGA-reactive fragments, derived from human histone #1.5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disquosing ulcerative colitis or susceptibility, by detecting complex formation between microbial porion antipen and perinuclear anti-neutrophil oytoplasmic autoantibodies.
                                                                                                                                                              Olocrative colitis; inflammatory bowel disease; porin antigen;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention provides a method for the diagnosis, prevention and contractive objects (10) using histore HI-like attigen. a porth antigen or a Bacteroides antigen as a target attigen. The horizant method of diagnosing UC in a subject susperded of having inclammatory howel disease (FID) computes; (1) obtaining a sample from the subject; (2) contacting the sample with a histone HI-like antigen, or perinuclear anti-resurrophil cytoplasmic antibody (pANCA) reactive fragment, to complex of the histone HI-like antigen, or the pANCA-reactive fragment, or presence or absence of the complex; where the presence of the complex; where the presence of the complex of antigen, porth and Bacteroides antigen are useful in the configuration, porth and Bacteroides antigen are useful in the configuration; prince and Bacteroides antigen are useful in the configuration; prince the lastone HI is the present of the complex of the configuration and Bacteroides antigen are useful in the configuration; prince HI isoform HI 5 pANCA-reactive fragment.

```
The invention provides a method for the diagnosis, prevention and

Contractment of ulcerative colitis (UC) using Mistone Hillike antigen, a
portin antigen or a Bacteroides antigen as a target antigen. The novel

Experimental diagnosing UC in a subject suspected of having inflammatry

boxel disease (IND) comprises: (1) Tobtaining a sample from the subject:

Contacting the sample with a histone Hillike antigen, or perinuclear

anti-neutrophal cytoplasmic antibody (pANCA)-reactive fragment, or

complex of the histone Hillike antigen, or the pANCA-reactive fragment,

complex of the histone Hillike antigen, and (3) destecting the

presence or absence of the complex, where the presence of the complex

confidence that the subject has UC; The pANCA-reactive histone Hillike

antigen, porth antigen and theatment of UC. The methods can also be used

Confidence the subject of the treatment of UC. The methods can also be used

Confidence and the subject of the treatment of UC. The methods can also be used

Confidence and the subject of UC. The persent sequence

represents a human histone Hills for treating UC. The present sequence
                                                                                                                                                                                                                                 Use of histone H1, porin or Bacteroides antigens as targets for the diagnosis, prevention and treatment of ulcerative colitis \cdot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ulcerative colitis; inflammatory bowel disease; porin antigen; pakNa, perinuclear anti-reurophil cytoplasmic antibody; human histore HI; isoform; MANUC-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human histone H1.5 pANCA-reactive fragment (residues 170-184).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ouery Match 100.0%; Score 22; DB 20; Length 15; Best Local Similarity 100.0%; Pred. W07270-90 examples of amphiphilic antimicrobial popules for comparison to chained amphiphilic antimicrobial peptides (M7575-69) and show that TELATHORY minor changes in scructure can have significant consequences as regards the antimicrobial activity of the molecules. The IOP XLILS were predicted against 5: aureus and against 8: ooli, and values of more
                                                                                                                                                                                                                                                                                                                              The invention provides a method for diagnosing ulcerative colitis in a subject suspected of hardyn inflammentory lowed disease. The method comprises reacting a patient sample with a porth antigen that is farmonologically reactive with paNot, perinologically reactive with paNot, perinologically exactive interpretation cytoplasmic antibodies) and detecting formation of a Ag-paNot complex indicative of ulcerative colitis. The method is used to diagnose ulcerative collisis or suspecibility to it. Sequences 157362-167.
                                                                                                                                Diagnosing ulcerative colitis or susceptibility, by detecting complex formation between migrobla porin autigen and perinuclear anti-neutrophil oytoplasmic autoantibodises.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gabs

than 5 and 4 respectively, correspond to greater antimicrobial activity. Effective antimicrobial peptides are discriminated from infefective peptides by a vectorial analysis on dimensions corresponding to charge hydropholis/lipophile balance, hydropholis moment and amphibilitity of the peptides, where effective peptides fall into the region which is anti-clockwise of the amphibilicity dimension and clockwise of the charge dimension. Effective peptides fall into the region which is nectored by the peptides to the peptides are further discriminated from appendance of the peptides to their biological activity gather specific antibacterial or peptides can be used in antimicrobial, prefinanting carrial or straing carrial or antificated or sufficiently or specific antibacterial or sufficients. They can be used for the distinguished or sufficients or the processes.

Murine epsilon RMP internal sequence.

Epsilon receptor modulating protein; IgE; CD23; class switching; allergy inflammation; partial sequence.

The synthetic sequence is a 19 amino acid sequence with cysteine inserted into tiz N terminus whose sequence was based on the inserted into tiz N terminus whose sequence was based on the protein. The synthetic oligopeptide was conjugated to keyhol limpet haemocyania and used to imminis 8 week ol female Lewis rate. The spleams were fused with non secreting mouse 8 cell myseloma, Po. Ammunogen and with native epsilon RMP.

Immunologically active liq. for e.g. research into allergy etc. contq. epsilon-receptor modifying protein of specified characteristics, used opt. with specified immuno-globin-E-suppressive protein etc. Disclosure; Page 34; 75pp; English.

The peptide represents an internal sequence of the 17 kD epsilon receptor modifating protein (RMP). The protein may be used to modify the immune response of a manmal. Spalion RMP together with . I. Can intitate class switching to type synthesis. The mols are late useful for treating allergic reactions, e.g. inflammation and in immunological research and in immunological research and in immunological therapy on humans and other animals. See also R22753.

This invention describes novel heparin binding molecules (I). The molecules (I) are useful as heparin antagonist drays for cardiovascular application and specifically neutralize heparin size of conternational anticonal conternational anticonal conternations of heparin locally e.g. in bleeding wounds, vascular anastomoses or pharmaccantical composition with insulin, as a substitute for protamine for use in treating diabetics. The heparin binding molecules (I) so specifically neutralize heparin's conventional unitcognism (properties without causing delecerious hemodynamic side-effects or exacerbation of the proliferative vascular response to injury. (I) are short-duntation, intravenous drugs to be used in elective or emergency situations which can affect and appearing neutralize heparin's specificative response to injury. This sequence represents a heparin-binding peptide described in the method of the invention.
                                                                                                                                                 Heparin binding peptide; antagonist; cardiovascular; coagulant;
bleeding wound; vascular anastomoses; leaking prosthetic vascular graft;
protamine substitute; treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New heparin binding molecules, useful for reducing heparin content in a mammal by reducing the anticoagulant effects of heparin - \,

```
hypothetical protein - Delinococus radiodurans (strain R1)
CSpecies: Delinococus radiodurans
CSP Radiodurans
R.J. Radiodurans
SSP Radiodurans
R.J. Reference 286, 1777, 1377, 1393
R.J. Reference mumber: MSSSO; MUD:20036896
R.J. Reference mumber: MSSSO; MSSSO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              hypotherical protein 153P4A, b - Caenorhabditis elegans

```
The elastomeric material of the invention comprises a bioelastomer courty, repeating elastometric tetraperide or pertaceptide units opt. modified by hexaperide units, the units consisting of hydrophobic A residuce and GV residuces and existing in a conformation having a beta-turn. The beta-turn of the the bioelastomer comprises on a polymentoperide unit of yeave (see P9130) and/or IFGVG (see P91301), and or a polymentoperide repeating unit of formula XXXG (see P91311), or a polymentoperide repeating unit of formula XXXG (see P91311), and the hexaperide repeating unit of formula XXXG (see P91312), and the hexaperide
 Sequence of peptides targeted to infections and atherosclerotic plaque.
 New technetium-99m labelled polypeptide imaging agents · for maging of clubs. Immours, intection stress, athereosclerotic and amyloid plaques or bone, and for visualising organs

 The amino acid sequence is that of a synthetic peptide derived from elastin, a vascular associated protein. The peptide, which may opt. be labelled, is used to detect injuries in the vascular system, espatheroscierosis in its early stages before it causes stemos; and blood flow disturbances. It can also be used to inhibit binding of low density lipoprotein (LDD, to vascular walls, i.e. to prevent or allewide atheroscierosis. It is easy to prepare on a large scale and allows vascular regions to be located non-invasively without complex equipment or highly skilled personnel. See also RISISG-RISI40.
Synthetic peptide(s) comprising amphiphilic domain of apoA-I - used to disquose vascular injury or disease or inhibit binding of low density lipoprotein to vascular walls in treating atherosclerosis

Saps
 Inhibiting binding of low-density lipoprotein to vascular walls - by administering peptide with affinity for vascular injury sites
having covalently bound to them a moiety which can bind a rc-99m radiolabel. The peptides having rc-99m bound to them are useful a scinitizaphic imaging agents for imaging sites of infection and inflammation in the mammalian body, e.g. caused by ischaemat, inflammation by bowel algorder, arthritis or tumours. The present sequence is a specifically claimed example of such a peptide derived from elastin.
 Binding inhibitor; low-density lipoprotein; LDL; vascular wall; vascular injury; elastin; collagen; prevention; treatment; vascular disease, atherosclerosis.
 ó
 A movel method for inhibiting the binding of a low-density lipoprotein (LDI), or vascular walls in vivo, comparises administering a synthetic water soluble peptide containing an amphiphilit domain and having affinity for sites of vascular injury, e.g. the present peptide.

The peptide inhibits the binding of LDL to vascular wall components, e.g. elastin and collagen, and so can be used to prevent or treat vascular diseases, e.g. atheroscierosis.
